Sidewalks and Public Safety

Purpose

Automatic Enforcement Cameras

Red Light cameras are extremely controversial. These are automated ticket-issuing systems that are placed at busy intersections, designed to detect when a motorist enters the intersection on a red light. If this is detected, the camera will take multiple images of the car during the process of the violation. A few weeks later, the motorist will get an unwelcome surprise in the mail!

Red Light Camera on a Pole scanning for speeding offenders

You can tell a red light camera apart from other camera systems by location (always mounted near a busy intersection) and appearance. Whereas ANPR cameras are usually small and consist of just one or two modules, red light cameras tend to be bulkier and consist of a large camera box and two external flashes, often mounted separately on poles. There will also often be multiple red light cameras at each intersection, to capture angles from multiple directions.

Location in District 1

On the corner of Johnson Ave. & Prospect Road
